Mohammed Ouchene

# The project

- Mike, a freelance Web Designer based out of Atlanta, hired me to optimise his website
- My goal was to boost Mike's **local clients**, improve his overall **SEO** and **accessibility**, and enhance the site's **mobile UI**
- To help me make the necessary changes, I used Lighthouse (an open-source Google auditing tool), the WCAG guidelines, the W3C Markup Validation Service

# Actions Taken To Optimise The Website:

## SEO and Performance:

- Prioritised long-tail transactional keywords in meta and title tags.
- Updated titles of the pages.
- Updated and improved site description.
- Removed all methods used for black hat SEO(Keywords repeated often in alt attributes for images, keywords written in the same colour as background colour in order to hide them...etc)
- Improved the website performance and its loading speed by compressing and minifying large files resources(JS, CSS).
- Better exploitation for the images by compressing them, resizing them and giving them explicit width and height properties.
- Restructuring the architectural structure of the website by leaving only one main heading(h1) and multiple subheadings (h2, h3,..) in the page.

## **ACCESSIBILITY:**

- Added lang attribute to Html file.
- Implemented semantic HTML.
- Added detailed [alt] attributes to all images.
- Made UI responsive for mobile.
- Replaced images with text where appropriate.
- Made the site more readable by changing text colour and size.
- Increased colour ratio to meet WCAG guidelines.
- Fully validated HTML & CSS with W3C Markup Validation Service.
- Used Aria labels where appropriate.
